

Warm-Up (EOC Type) 3/5/18

The graph below shows the function $a(x)$.

Over which interval is the ⁽¹⁾ function increasing and the value of the function positive?

A. $(-\infty, 2)$

B. $(-4, 2)$

C. $(2, 8)$

D. $(-4, 0)$

(2)

$$(-4 < x < 8)$$

DAY 6-5: GRAPHING IN INTERCEPT (FACTORED) FORM

Unit 3B: Quadratic Functions

Review

Graph the following equations in standard form and factor the quadratic (you may use a calculator to compute):

$a = 1$ $b = -2$ $c = 1$

1. $y = x^2 - 2x + 1$

$x = \frac{-b}{2a}$

$x = \frac{-(-2)}{2(1)} = 1$

$f(1) = (1)^2 - 2(1) + 1$

$f(1) = 0$

Vertex:

$(1, 0)$

y-int: $(0, 1)$

x	-1	0	1	2	3
y	4	1	0	1	4

$x^2 - 2x + 1$

Factored Form:

$(x-1)(x-1)$
 $(x-1)^2$

x-int: $(1, 0)$

Review Continued

$$2. y = x^2 + x - 6$$

$$a = 1 \quad b = 1 \quad c = -6$$

$$x = \frac{-b}{2a} = \frac{-1}{2(1)} = -\frac{1}{2}$$

Vertex:

x					
y					

Factored Form:

What did you notice about the factored form and the x – intercepts of the graph?

The x-intercepts are the opposite of the #s in the factored form.

What did you notice about the x – value of the vertex and the x – intercepts?

The x-value of the vertex is one of the x-intercepts.

We learned in Unit 3A how to factor, but we can also graph in factored form!

Factored Form of a Quadratic Function:

$$y = a(x - p)(x - q)$$

a determines how the graph opens

&

The x - intercepts are $(p, 0)$ and $(q, 0)$.

How do we graph in Factored Form?

Graphing in standard form is similar to graphing in standard form, but the way we find our vertex is different. We use a special formula to find the x - coordinate of our vertex, and substitute that value in our equation to determine the y - coordinate of our vertex. The formula is:

$$x = \frac{p+q}{2}$$

For example, say we have $y = (x + 7)(x + 1)$, how would we find our vertex?

$$X = \frac{-7 + (-1)}{2}$$

$$= \frac{-8}{2}$$

$$X = -4$$

$$y = (-4 + 7)(-4 + 1)$$

$$y = (3)(-3) = -9$$

$$V = (-4, -9)$$

Lets Practice!

1. $y = (x + 1)(x + 3)$

x-intercepts: $x = -1$ & $x = -3$

$$x = \frac{-1 + (-3)}{2} = \frac{-4}{2} = -2$$

$$f(-2) = (-2 + 1)(-2 + 3) = (-1)(1) = -1$$

Vertex = $(-2, -1)$

$$\begin{aligned} 1^2 &= 1 \\ 2^2 &= 4 \\ 3^2 &= 9 \end{aligned}$$

$$2. y = (x + 4)(x - 2)$$

x-intercepts: $x = -4$ & $x = 2$

$$x = \frac{-4 + 2}{2} = -1$$

Vertex = $(-1, -9)$

$$\begin{aligned} 1^2 &= 1 \\ 2^2 &= 4 \\ 3^2 &= 9 \end{aligned}$$

$$3. y = -3(x - 7)(x + 3)$$

x-intercepts: $x = 7$ & $x = -3$

Vertex = $(2, 75)$

$$x = \frac{7 - 3}{2} = 2$$

$$\begin{aligned} & -3(2-7)(2+3) \\ & -3(-5)(5) \end{aligned}$$

4. $y = (x - 6)^2$
x-intercepts: $(x-6)(x-6)$
 $x = 6$ & _____

$$x = \frac{6+6}{2} = 6$$

Vertex = $(6, 0)$

Steps for Graphing in Intercept or Factored Form

1. Find the vertex. After using the formula $x = \frac{p+q}{2}$ to find our x- coordinate of our vertex, we substitute that x back into our equation, and our solution is the y-coordinate of our vertex.
2. Determine your two x – intercepts.
3. Plot your points and connect them from left to right!

EXAMPLE 1

Example 1: Graph $y = (x + 2)(x - 2)$.

x-intercepts: $(x = -2)$ $(x = 2)$

Vertex: $\frac{-2 + 2}{2} = 0$

$$f(0) = (0 - 2) \cdot (0 + 2)$$
$$(0, -4) \quad 2 \cdot -2 = -4$$

EXAMPLE 2

Example 2: Graph: $y = -(x+1)(x-7)$.

x-intercepts: $x = -1$ $x = 7$

Vertex: $\frac{-1+7}{2} = 3$

$$f(3) = -1(3+1)(3-7)$$
$$(3, 16) \quad \begin{matrix} -(4 \times -4) \\ -1(-16) \end{matrix}$$

EXAMPLE 3

Example 3: Graph $y = 2(x - 1)(x - 3)$.

x - intercepts:

Vertex: $x = 1$ $x = 3$

$$1^2 = 1 \cdot 2 = 2$$

$$2^2 = 4 \cdot 2 = 8$$

$$3^2 = 9 \cdot 2 = 18$$

$$(2, -2)$$

$$f(2) = 2(2 - 1)(2 - 3)$$

$$= 2(1)(-1)$$

$$f(2) = -2$$

EXAMPLE 4

Example 4: Graph: $y = -(x - 3)^2 = (x - 3)(x - 3)$

x - intercepts:

$$x = 3 \quad V = (3, 0)$$

Vertex:

$$\frac{3 + 3}{2} = 3$$

$$f(3) = -(3 - 3)(3 - 3)$$

$$f(3) = 0$$

HW: Day 6 Graphing in
Intercept Form a - d, # 1 - 8
Due on Tuesday, 3/6/18
